Teleperformance SE

INTERNAL OPERATIONS & SYSTEMS MANAGEMENT MANUAL

Teleperformance scales global omnichannel customer experiences, identity verification, and complex technical support operations across 170 countries. The organizational infrastructure relies heavily on automated data pipelines, central workforce logistics, and a zero-trust network perimeter to manage high-volume enterprise programs securely.

> **Ecosystem Baseline Metrics:**
>
> - **Global Headcount:** Approximately 500,000 personnel, supported internally by an enterprise IT team of 8,000 technicians.
> - **Unified Production Environment:** Global ServiceNow production instance utilizing real-time queue synchronization.
> - **Core Mandate:** Balancing prompt, contextual customer support resolution cycles with strict physical and digital identity validation.

1. COMPANY MISSION AND CORE VALUES

The operational framework focuses on resolving customer issues safely and with extreme precision. Business delivery is anchored to five distinct corporate principles: Integrity, Respect, Professionalism, Innovation, and Commitment. Support components and automated script logic must continuously align with these parameters to ensure regulatory compliance and strict operational ownership.

2. CORE OPERATIONAL DEPARTMENTS

Department	Primary Operational Responsibility & Infrastructure Scope
Operations & Delivery	Manages front-line interaction touchpoints, tier-2 diagnostic support helpdesks, and live client queues across voice and digital channels.
Trust & Safety	Handles deep content moderation, risk mitigation, fraud analysis, and enforcement of regulatory policies across client portals.
Workforce Management	Coordinates shift optimization patterns, interaction volume forecasting algorithms, real-time line adherence, and employee roster lifecycle management.
Quality & Compliance	Executes interaction monitoring audits, transactional quality reviews (QA scoring), continuous coaching feedback loops, and process corrections.
TP.ai & Transformation	Deploys advanced machine learning pipelines, processes contextual business automation layers, and maintains integrated agent copilots.
IT Operations & Infosec	Secures core WAN architecture, performs regular endpoint posture reviews, configures corporate gateways, and maintains identity vaults.

3. REGIONAL FOOTPRINT & INDIA BRANCH NETWORK

Teleperformance maintains a highly developed delivery footprint across India, operating with over 90,000 specialized customer experience and support professionals stationed across more than 35 production sites and covering 70+ domestic cities. Core geographic centers are structured as follows:

Major Technology and CX Campuses: High-volume physical operations are concentrated in key urban zones. The Gurugram campuses (situated in Cyber City and Udyog Vihar) form a principal operations hub alongside Noida footprints. The Hyderabad network features a massive centralized presence at Raheja Mindspace housing over 3,500 personnel. The Mumbai region is anchored by large enterprise centers in Malad and Goregaon, while the delivery infrastructure leverages strategic technology complexes across Marathahalli and Electronic City in Bengaluru. Additional regional operations are handled via established sites in Pune, Jaipur, Indore, Ahmedabad, Chennai, and Mohali.

Domestic Delivery Hubs: Regional tier-2 and tier-3 programmatic delivery is managed through localized operations in cities such as Kochi, Vadodara, Kolkata, Secunderabad, Agra, and Thane, providing distributed resilience across localized vertical markets.

4. COMPENSATION, SALARY, & PAYROLL POLICY

Employee compensation is structured in alignment with local regional guidelines and formal offer agreements. Salaries are processed monthly and directly credited to designated corporate salary accounts (such as Kotak Mahindra Bank profiles) on the last working day of the calendar cycle. Operational Customer Experts receive compensation details, itemized payslips, and tax withholding declarations directly through the Workday payroll module. Maintenance of active bank details, completion of mandatory compliance items, and e-KYC validation tasks are strictly required within the candidate platform to prevent processing delays.

5. EMPLOYEE LEAVE & ONBOARDING FRAMEWORK

Standard full-time personnel receive a localized paid annual leave allocation aligned with statutory parameters (typically ranging between 15 and 25 days depending on the country or region), supplemented by 10 sick leave days per calendar period. Planned absences must be submitted through the internal HR portal at least 7 to 14 days in advance and require direct supervisor approval. Unused vacation tracking supports standard rollover allowances up to 5 days depending on regional operational rules. Upon clear validation of background criteria, preliminary candidate screening profiles, and communication evaluations, incoming personnel are provisioned a unique Window/NT ID to access active shift floors.

6. REMOTE OPERATIONS (TP CLOUD CAMPUS)

Under the formal TP Cloud Campus operational model, eligible employees can work remotely under an optimized hybrid structure for up to three days per week. Remote configurations utilize dedicated virtual desktop infrastructure (VDI) monitored by centralized cloud command centers based in Mohali, Kolkata, and Gurugram. These centers perform automated, continuous environment security sweeps and network ping checks. Fully remote or permanently distributed deployment models require written structural sign-off from both the business unit Operations Manager and the Site HR Director.

7. EQUIPMENT & CONNECTIVITY INFRASTRUCTURE REIMBURSEMENTS

Personnel operating under validated Work-from-Home criteria receive a home internet stipend of up to $50 per month to cover high-speed data connectivity paths dedicated exclusively to secure corporate VPN tunnels. Approved new hires inside specialized technical processing tracks are provisioned with a one-time

workspace setup budget of up to $600 to acquire ergonomic infrastructure and authorized accessories from the internal procurement supply catalog.

8. TECHNICAL SERVICE LEVELS & PRODUCTION BENCHMARKS

Teleperformance platform environments enforce strict latency boundaries, targeting average transaction processing times under 250 milliseconds during peak traffic. Main communication gateways and internal routing APIs maintain a strict availability target of 99.99% operational uptime.

System exceptions are classified across clear priority tiers: SEV-1 (Critical Outage), SEV-2 (High Degradation), and SEV-3 (Standard Operational Issue). A SEV-1 production failure triggers an automatic notification protocol to page the on-call systems infrastructure engineer, carrying a maximum response acknowledgment threshold of 5 minutes. The structural system error code `ERR_CONN_8421` marks a condition where the central database connection pool is completely exhausted, requiring automated connection recycling routines to restore desktop tool performance.

9. PLATFORM DEPLOYMENTS & INCIDENT REVIEWS

During the production cycle of August 17, 2026, engineers deployed patch release 4.8 to the primary payment-routing microservices. Immediate post-deployment logs revealed unexpected application latency spikes across internal user screens. On August 20, 2026, an operations evaluation panel directed an emergency configuration rollback. The subsequent root-cause analysis identified extensive query pool lock contention as the source of the slowdown, prompting a return to baseline configuration metrics to stabilize internal applications.

10. SECURITY ARCHITECTURE AND CONCURRENCY SAFEGUARDS

Connecting personal or unvetted external hardware to the corporate network is strictly prohibited. Production endpoints operate under continuous full disk encryption, requiring hardware tokens (MFA) to clear the Teleperformance secure VPN gateway. Active user desktop access is limited using strict session concurrency rules: an individual NT ID is constrained to exactly one active desktop session globally to block cross-terminal data leakage and credential exploitation. Production configurations, routing rules, and database schema diagrams are restricted entirely to certified engineering staff.

11. IT SERVICE DESK ESCALATION TIMELINES

All internal technician tickets created inside ServiceNow route into prioritized work queues based on urgency: Critical, High, Medium, or Low. Desktop tool failures that stop immediate client service delivery have an internal resolution protocol baseline of 15 minutes, whereas routine user inquiries scale inside 24 business hours.
